# Fire detection for what ?

## Before MSG

*“For Europe, priority was assigned to the development of a **fire risk assessment** application, while for Africa monitoring of the climatic, atmospheric, and ecological impacts of **biomass burning** was considered the more important issue....”*

**(Pereira and Govaerts, 2001)**

## After MSG

*“Detection and systematic monitoring of active fires over the African continent is essential for an accurate assessment of the overall fire activity.... Active fire detection over Europe is essential for early fire warning and for fire prevention, **namely in what respects to a proper calibration of risk of fire indices**” ... (Eumetsat LSA SAF, 2009)*

*“Over Africa ... climatic, atmospheric and ecological processes ...thus, detection and monitoring of burning activity, using MSG imagery at the maximum temporal resolution, is the key to **characterize vegetation fires at the higher frequency cycles, e.g. daily or even weekly**”.....”Fire detection and monitoring over Mediterranean Europe...is **also relevant for civil protection and forest protection activities**”... (Amraoui, 2010)*

North-Italy WINTER (17 Feb 2005)

## Single image – fixed threshold methods: main issues

- High false alarm rate / low sensitivity
- Performances strongly depending on time/place of implementation
- Low exportability on different geographic areas
- Low exportability on different/new sensors

Kaufman method

# Tradictional single image, fixed thresholds, approaches

anomalies ?

Tradictional single image, fixed thresholds, approaches

# lower thresholds increase sensitivity...

anomalies ?

but false alarms too !

Tradictional single image, fixed thresholds, approaches

# higher thresholds increase robustness...

anomalies ?

**but reduce sensitivity**

# What “anomaly” means ?

a different approach:

# RST (Robust Satellite Techniques)

(formerly **RAT**: **R**obust **A**VHRR **T**echniques, V. Tramutoli, 1998, 2005, 2007)

- **Computing the unperturbed reference fields for  $V(r,t)$  on a multi-temporal long-term HOMOGENEOUS (same time of the day, months of the year, etc.) historical satellite records**

- **Change detection at the time  $t$  by:**

$$\otimes_V(x, y, t) = \frac{V(x, y, t) - V_{REF}(x, y)}{\sigma_V(x, y)}$$

**A.L.I.C.E.**

# 15 years of RST Applications

Using several satellite/packages

- NOAA (AVHRR, AMSU)
- EOS (MODIS, AMSRE)
- METEOSAT, MSG (SEVIRI and GERB), MTSAT, GOES

from Visible to the IR and Microwave spectral range

Recently successfully applied also to ground observations  
(e.g., Nunnari et al., 2008)

# 15 years of RST Applications

For two main classes of environmental processes:

## short scale changes

- Volcanic eruptions (*e.g. Remote Sens. of Env.*, 2004a, 2004b, 2007, 2011)
- Forest fires detection (*e.g. Int. J. of Rem. Sens.*, 2001, *ICFFR*, 2010)
- Oil spill and water monitoring (*NHESS*, 2011, *Int. J. Rem. Sens.*, 2011, *AGU Books*, 2011)
- Cloud-detection (*e.g. Atmosph. Research.*, 2004)
- Radio interference monitoring (*IGARSS 2010, IEEE-TGRS 2012*)
- Energy production and transport systems monitoring (*IGARSS 2010, IEEE-TGRS 2012*)
- Rapid alert for security purposes (*Multitemp 2007.*, *Springer Verlag Book*, 2009)

## medium, long scale, changes

- Dust storms, air quality and pollution monitoring (*IRS*, 2001, *Multitemp 2009, IGARSS*, 2009)
- Soil Wetness and monitoring (*e.g., Rem. Sens. Env.*, 2005, 2010a, 2010b, *Phys. Chem. Earth.*, 2006)
- Flood monitoring and mapping (*Int. J. Rem.Sens.*, 2010, *Multitemp 2009*)
- Earthquakes precursors (*Phy. Chem.Earth*, 2004, *Rem.Sens.Env.*, 2005, *Tectonoph.*, 2007, *NHESS*, 2009 °-b, 2010)

# 15 years of RST Applications

## Forest fires

e.g. Fires in Italy, February 2005

## Volcanic Eruptions

e.g. Etna eruption Oct 2002

## Floods

e.g. Ungary flood, April 2002

## Dust storms

e.g. Libia 13 May 2004

## Oil spills

e.g. Oil spill in the Persic Gulf, January 1991

## Soil wetness

e.g. Carpathian Basin, April 2000

## Earthquakes

e.g. 7 September 1999 Athens Earthquake

## Infrastructures

e.g. 18 October 2005 IRAQ

# RST-FIRES Approach

$$\otimes_V(x, y, t) = \frac{[V(x, y, t) - \mu_V(x, y)]}{\sigma_V(x, y)}$$

Generic RST ALICE index

$$\otimes_{MIR}(x, y, t) = \frac{[T_{MIR}(x, y, t) - \mu_{MIR}(x, y)]}{\sigma_{MIR}(x, y)}$$

For Polar satellites (MODIS, AVHRR, etc.)

**NO MISSED NO FALSE FIRES**

# **Are Validation Methods Affecting Algorithms Quality ?**

# The Total Validation Experiments In Italy (2007-2012)

# Traditional “a posteriori” Validation Approach

*A posteriori*  
Validation

official databases of occurred fires, compiled by local agencies

*affected by filling mistakes*

- time of occurrence
- duration of an event (start and end time)
- the exact localization
- may be also incomplete about “all” the occurred events

- fires that spread in remote and uninhabited area
- events just temporarily noted but then deleted when no significant fire develops
- very small fires - the agencies do not act on them (*according to legal requirements*)

biased towards large events, not so punctual and reliable, erroneously flagging all thermal anomalies, detected in correspondence of unregistered events, as false alarms !

# MOST FREQUENTLY USED VALIDATION METHODS

## Visual inspection (MIR images)

- Only fires with a large contrast between fire-affected pixel and surrounding pixels may be visually identified (no small/starting fires).

## Information registered in official databases

- Results depend on minimum size registered events (sometimes variable during the time, e.g. from 0.1 ha in 1980–1990 to 0.001 ha in 1992–2005 for the Portugal rural database), completeness and correctness of registers, fire type (forest, burning stubbles, etc), etc.

## Sensor-to-sensor comparison (MODIS, BIRD, ASTER, ETM+, ...)

- depends on strategies for taking into account for differences of satellite data in terms of spatial and temporal resolution (sometimes also spectral characteristics). Even complicated strategies should be found (e.g. Calle et al., 2008; EUMETSAT LSA SAF, 2009) or, at least, different comparison scales should be considered (e.g. like in Roberts and Wooster, 2008).
- comparison with polar satellites implies restriction due to their limited number of passages per day than geostationary.

## Validation campaigns

- Use of aircraft validation campaigns/experiments was one of recommendations of GOFC-GOLD 2006

# Total Validation Approach (TVA)

*TVA*  
*Total Validation*  
*Approach*

systematic ground or aerial check of the  
origin of the RST fires submitted to validation

*working together with local agencies and decision  
makers*

- made in a pre-operative scenario
- statistics based only on the analysis of thermal anomalies submitted to direct inspection

*TVA allows us to recognize several thermal anomalies (associated to small fires, to variations of thermal emission in industrial plants, etc.) are not false alarms even if they are not associated to officially documented forest fires*

# Lombardy TVA: first lessons learnt

Many kinds of *actual hot sources* are able to produce thermal anomalies, otherwise classified simply as false alarms by traditional *a-posteriori* validation like:

1. *Small fires* (burnt area less than 0.2 ha)
2. *Unsighted or late-sighted fires* (due to their remote position respect to ground traditional monitoring systems)
3. *Cleaning fires* (like burning stubbles, burning reeds, etc.)
4. *Anthropic accidents* (like explosions, industrial accidents, etc.)
5. *Industrial plants*

Detection 20 hours before !

# RST-FIRES Approach

$$\otimes_V(x, y, t) = \frac{[V(x, y, t) - \mu_V(x, y)]}{\sigma_V(x, y)}$$

Generic RST ALICE index

$$\otimes_{MIR}(x, y, t) = \frac{[T_{MIR}(x, y, t) - \mu_{MIR}(x, y)]}{\sigma_{MIR}(x, y)}$$

For Polar satellites (MODIS, AVHRR, etc.)

$$\otimes_{\Delta MIR}(x, y, t - t_0) \equiv \frac{\Delta T_{\Delta MIR}(x, y, t - t_0) - \mu_{\Delta MIR}(x, y)}{\sigma_{\Delta MIR}(x, y)}$$

for Geostationary Satellites (MSG, MTSAT, GOES)

$$\otimes_{\Delta sMIR}(x, y, t) \equiv \frac{\Delta T_{\Delta sMIR}(x, y, t) - \mu_{\Delta sMIR}(x, y)}{\sigma_{\Delta sMIR}(x, y)}$$

# “SPATIAL” COMPONENT OF RST-FIRES

CONTEXTUAL-LIKE ALGORITHM COMPUTING DEVIATION OF THE BT FROM A SPATIAL AVERAGE OF SURROUNDING PIXELS ( 7X7 BOX)

IN COMPUTING BT DEVIATION, NEAREST NEIGHBORS AND CLOUDY PIXELS WERE EXCLUDED AND REMOVED BEFORE SPATIAL AVERAGE COMPUTATION

# “SPATIAL” COMPONENT OF RST

$$\square - A = \triangle S$$

DEVIATION BETWEEN BT OF THE CENTRAL PIXELS AND THE SPATIAL AVERAGE OF (CLEAR) SURROUNDING PIXELS

MULTI-TEMPORAL ANALYSIS TO DERIVE “REFERENCE FIELDS” (TEMPORAL MEAN AND STANDARD DEVIATION) OF SUCH A DEVIATION FOR EACH IMAGE PIXEL

$$\mu_{\Delta sMIR}$$

$$\sigma_{\Delta sMIR}$$

$$\otimes - \triangle S = \frac{\triangle S - \mu_{\Delta sMIR}}{\sigma_{\Delta sMIR}}$$

# RELIABILITY: DOUBTS ABOUT SOME GROUND CHECKS

Palermo Regional Province campaign 2011

Thermal anomaly automatically detected by RST-FIRES over MSG-SEVIRI image of 5 August 2011 at 10:15 GMT (lat: 37.84408 N; long: 12.9586 E).

**CFS and voluntaries from watch towers did not confirm any event.**

At 10:15 GMT, signal excess ( $\Delta T_{\Delta s} - \mu_{\Delta s}$ ) is **3.82** times greater its normal variability  $\sigma_{\Delta s}$

Between 10:00 and 10:15 GMT, signal excess ( $\Delta T_{\Delta t} - \mu_{\Delta t}$ ) is **12.87** times greater its normal variability  $\sigma_{\Delta t}$

# Correcting official reports

19 October 2005 "...attack on an oil pipeline at Al-Ishaqi village south of Samarra..." by the web site <http://www.iags.org/iraqpipelinewatch.htm>).

A first analysis highlighted that the accident actually **took place on 18 October 19:30 GMT (and not on 19 as reported by news!)**, even if the oil fire continued burning until the day after.

Daily brightness temperature from SEVIRI images during 18 October 2005 in correspondence of the area affected by the pipeline blast: a strong unexpected increase of temperature is evident at 19:30 GMT.

# The case of Moscow explosion (9 May 2009)

<http://englishrussia.com/index.php/2009/05/11/moscow-blast-2/>

<http://news.bbc.co.uk/2/hi/europe/8042278.stm>

On 9 May 2009 at 20:20 GMT (i.e. 10 May 2009, 00:20 Moscow time), a gas pipeline explosion took place in Moscow, sending flames 100m (300ft) high into the air and setting fire to a nearby building.

<http://www.kavkazcenter.com/eng/content/2009/05/10/10689.shtml>

According to Russian mass-media, the explosion caused damages to Physicochemical Scientific Research Institute of Lev Yakovlevich Karpov which is, according to official data:

1. A strategic factory,
2. An organisation, running dangerous production (involving radioactive material) and facilities
3. A factory of defense-industrial complex.

According to unofficial data, the Institute works in the field of secret production of the chemical weapons, and, probably, also the nuclear.

# The case of Moscow explosion (9 May 2009): RST-based detection system

**Before explosion** (map based on SEVIRI acquisition of 9th May 2009 at **20:15 GMT**):

**at 20:15**

**no RST-based thermal anomaly is detected in the Moscow area**

# The case of Moscow explosion (9 May 2009): RST-based detection system

After the explosion

**at 20:30 GMT**

**two strong RST-based thermal anomalies are detected in the SW Moscow**

Map Production Date: 23/02/2010

MOSCOW, RUSSIA: HOT SPOTS 09-05-2009 20:30 GMT

CTA-CAE-01-MOSCOW-04.cta

MCC-S-VI brightness temperature (channel 3.9  $\mu\text{m}$ )

# The case of Moscow explosion (9 May 2009): RST-based detection system

The RST-based detection (between 20:15 GMT and 20:30 GMT) of thermal anomalies related to the Moscow explosion is in perfect agreement with news

[http://news.xinhuanet.com/english/2009-05/10/content\\_11345157.htm](http://news.xinhuanet.com/english/2009-05/10/content_11345157.htm)

ovskaya street in Moscow May 10, 2009. (Xinhua/Reuters Photo)

the fifth victim, with eight percent of his body burned, refused to go to hospital.

ssaid the fire was currently decreasing, but they would need at least five more hours

ing pipelines might be the cause for the explosion.

## flame burst at the Oil Center of Viggiano Italy (20/11/2008) (MSG-SEVIRI)

*Da: La Nuova del Sud, 27/11/2008*

previsto dello scorso giovedì che ha causato la fuoriuscita da uno degli impianti del Centro Oli di una fiamma di circa 30 metri che ha creato spavento i cittadini. Per fortuna quella dello scorso giovedì non era una situazione di allarme (alle 20,30 circa si sono attivati i sistemi di sicurezza al Centro olio di Viggiano in seguito ad un'erronea segnalazione dei sistemi automatici di protezione. L'episodio ha detto l'Eni- è legato al sistema di controllo preventivo), ma nonostante

## Correcting official reports

**RST Anomaly identified at 17:15 GMT  
(i.e. 2 hours before than reported !)**

MSG-SEVIRI data, 20 Novembre 2008

# CONCLUSIONS

- RST-FIRES allows to obtain un-precedent high reliability and sensitivity for timely detection (even very small) fires in different fire regimes
- SEVIRI seems then under exploited not only for fire detection but also for a wider range of possible applications requiring timeliness, rapid detection and short response times
- Some pre-processing aspects (e.g. re-sampling) and products (e.g. cloud masks) may impact on algorithm performances and might be re-discussed or revised
- Total Validation Approach required in order to avoid to wrongly address quality assessment of fire detection algorithms
